

# 3.1

## Squares and Square Roots

### Focus on...

After this lesson, you will be able to...

- determine the square of a whole number
- determine the square root of a perfect square

The Pythagoreans were members of an academy of study that existed 2500 years ago. They created square numbers by arranging pebbles in equal numbers of rows and columns. Nine pebbles could be arranged in three rows and three columns. Nine is a square number because  $3 \times 3 = 9$ . The picture shows the first four square numbers that the Pythagoreans found: 1, 4, 9, and 16. How can you determine the next square number?

### Literacy Link

A *square number* is the product of the same two numbers.  $3 \times 3 = 9$ , so 9 is a square number.

A square number is also known as a *perfect square*. A number that is not a perfect square is called a *non-perfect square*.

### Did You Know?

Pythagoras (about 580–500 B.C.E.) was the leader of a group of academics called the Pythagoreans. They believed that patterns in whole numbers could help explain the universe.

## Explore the Math

### How can you identify a perfect square?

1. Use square tiles to make five rectangles with the dimensions shown. What is the area of each rectangle?

Length (cm)	Width (cm)
5	3
8	2
9	1
4	3
9	4

### Materials

- square tiles

2. Try to rearrange the tiles in each rectangle to make a square.

- a) Which rectangles can you make into squares?
- b) What is the side length of each square?
- c) How is the area of each square related to its side length?

3. a) Choose three perfect squares and three non-perfect squares.

- b) Express each number as a product of prime factors.
- c) For each number, how many times does each prime factor appear? Compare your results with a partner's results.

4. a) What do all of the perfect squares have in common?

- b) What do all of the non-perfect squares have in common?

### Reflect on Your Findings

5. a) How can square tiles help you to determine if a number is a perfect square?

- b) How can prime factors help you to determine if a number is a perfect square?

### Literacy Link

#### Prime Numbers and Prime Factors

A *prime number* is a whole number greater than 1 that has only two factors: 1 and itself.

*Prime factors* are factors that are prime numbers.

For example, the prime factors of 10 are 2 and 5.

**prime factorization**

- a number written as the product of its prime factors
- the prime factorization of 6 is  $2 \times 3$

**perfect square**

- a number that is the product of the same two factors
- has only an even number of prime factors
- $5 \times 5 = 25$ , so 25 is a perfect square

**Example 1: Identify Perfect Squares**

- a) Determine the **prime factorization** of the following numbers: 24, 36, 81.
- b) Which of the numbers is a **perfect square**? Explain.
- c) For each number that is a perfect square, draw the square and label its side length.

Different factor trees are possible to arrive at the same prime factorization.

**Solution**

- b) To be a perfect square, each prime factor in the prime factorization must occur an even number of times. 36 and 81 are perfect squares because each prime factor occurs an even number of times.

$36 = 2 \times 2 \times 3 \times 3$     two factors of 2, two factors of 3

$81 = 3 \times 3 \times 3 \times 3$     four factors of 3

24 is not a perfect square because at least one of the prime factors occurs an odd number of times.

$24 = 2 \times 2 \times 2 \times 3$     three factors of 2, one factor of 3

- c) To determine the side length of the squares, look at the product of prime factors for the area.

$36 = 2 \times 2 \times 3 \times 3$

$81 = 3 \times 3 \times 3 \times 3$

Rearrange the prime factors into two equal groups.

$36 = (2 \times 3) \times (2 \times 3)$

$36 = 6 \times 6$

$81 = (3 \times 3) \times (3 \times 3)$

$81 = 9 \times 9$

**Show You Know**

Write the prime factorization of each number. Which number is not a perfect square? Explain how you know.

- a) 45    b) 100

## Example 2: Determine the Square of a Number

Determine the area of a square picture with a side length of 13 cm.

### Solution

$$A = s^2$$

$$A = 13^2$$

$$A = 13 \times 13$$

$$A = 169$$

The area is 169 cm<sup>2</sup>.

area of a square = side length  $\times$  side length

$$A = s \times s$$

$$A = s^2$$

### Show You Know

Determine the area of a square with a side length of 16 mm.

### Strategies

Draw a Diagram

### Literacy Link

You can write a repeated multiplication like  $13 \times 13$  as a square:  $13 \times 13 = 13^2$ .  $13^2$  is read as thirteen squared.

## Example 3: Determine the Square Root of a Perfect Square

Edgar knows that the square case for his computer game has an area of 144 cm<sup>2</sup>. What is the side length of the case?

### Solution

#### Method 1: Use Inspection

To find the side length, determine what positive number when multiplied by itself equals 144.

$$12 \times 12 = 144$$

The **square root** of 144 is 12, or  $\sqrt{144} = 12$ .

The side length is 12 cm.

### square root

- a number that when multiplied by itself equals a given value
- 6 is the square root of 36 because  $6 \times 6 = 36$

#### Method 2: Use Guess and Check

Find the positive value for the blank boxes.

$$\blacksquare \times \blacksquare = 144$$

$$10 \times 10 = 100 \quad \text{Too low}$$

$$13 \times 13 = 169 \quad \text{Too high}$$

$$12 \times 12 = 144 \quad \text{Correct!}$$

$$12 = \sqrt{144}$$

The side length is 12 cm.

### Literacy Link

#### Reading Square Roots

The symbol for square root is  $\sqrt{\quad}$ . Read  $\sqrt{9}$  as the square root of 9, square root 9, or root 9.

Method 3: Use Prime Factorization

The prime factorization of 144 is  $2 \times 2 \times 2 \times 2 \times 3 \times 3$ .

Rearrange the prime factors into two equal groups.

$$144 = (2 \times 2 \times 3) \times (2 \times 2 \times 3)$$

$$144 = 12 \times 12$$

$$\sqrt{144} = 12$$

The side length is 12 cm.

Tech Link

You can use a calculator to find the square root of a number. Try the following key sequences on your calculator. Then, record the one that works on your calculator.

C 144  $\sqrt{\quad}$  =  
or

C  $\sqrt{\quad}$  144 =

Show You Know

Determine the side length of a square with an area of  $196 \text{ cm}^2$ .

Key Ideas

- The square of a number is the number multiplied by itself.  
 $5 \times 5 = 25$ , or  $5^2 = 25$
- The square of a whole number is a perfect square.  $2^2 = 4$   
So, 4 is a perfect square.
- The square of a number can be thought of as the area of a square.  
 $4^2 = 16$   
The area is  $16 \text{ cm}^2$ .
- The square root of a number can be thought of as the side length of a square.  
 $\sqrt{16} = 4$   
The side length is 4 cm.
- The square root of a value is a number that when multiplied by itself equals the value.  
 $6 \times 6 = 36$ , so  $\sqrt{36} = 6$
- In the prime factorization of a perfect square, there is an even number of each prime factor.  
 $36 = 2 \times 2 \times 3 \times 3$       two factors of 2, two factors of 3

14. Determine the side length of a square with an area of  $900 \text{ cm}^2$ .
15. Evaluate.
- a)  $\sqrt{49}$       b)  $\sqrt{64}$       c)  $\sqrt{625}$
16. Determine the value.
- a)  $\sqrt{9}$       b)  $\sqrt{25}$       c)  $\sqrt{1600}$

### Apply

17. A fridge magnet has an area of  $54 \text{ mm}^2$ . Is 54 a perfect square? Use prime factorization to find the answer.
18. A floor mat for gymnastics is a square with a side length of 14 m. What is the area of the floor mat in square metres?

19. The gym teacher told the students to run twice around the perimeter of the school field. The area of the square field is  $28\,900 \text{ m}^2$ . What distance did the students run?
20. Adam's uncle has instructions for building a shed. One page of the instructions, shown below, is not very clear.

- a) What is the area of the rectangle?
- b) What is the side length of the square?

21. Kate is going to put a patio in her backyard. The patio stones she is using each have an area of  $1 \text{ m}^2$ . She has created the rectangular design shown.

- a) What is the area of the patio?
- b) What are the dimensions of another rectangular patio she could build with the same area?
- c) Kate decides to make a patio with the same area but she wants it to be a square with whole number side lengths. Is this possible? Explain your reasoning.
22. The world's largest city square is Tiananmen Square in Beijing, China. It has an area of  $396\,900 \text{ m}^2$ .

- a) What are the dimensions of the square?
- b) If the square had dimensions of 629 m by 629 m, what would be the area?
- c) If the square had an area less than  $394\,000 \text{ m}^2$  and greater than  $386\,000 \text{ m}^2$ , what are all of the possible whole number dimensions that it could have?
23. A helicopter landing pad has a square shape. The area is  $400 \text{ m}^2$ . Use prime factorization to find the side length of the pad.

## Extend

24. The first three triangular numbers are

- What are the next three triangular numbers?
  - Add together any two consecutive triangular numbers. What do you notice about the sums?
25. A square digital photo on the computer has an area of  $144 \text{ cm}^2$ .
- What is the side length of the photo?
  - The photo is enlarged so that the side length is now 36 cm. What is the area of the enlarged photo?
  - How many times as large as the original area is the enlarged area?

Imagine your dog is 80 cm tall and your cat is 40 cm tall.  
How many times as tall as your cat is your dog?  
What operation did you perform?

## MATH LINK

Chess is played on a square board. The board is made up of 32 white squares and 32 dark squares.

You decide to make your own chessboard. You are going to cut the board out of the 42 cm x 50 cm piece of wood shown.

Each square on the board will have whole number side lengths. The chess pieces fit on squares that are no smaller than  $9 \text{ cm}^2$ . What are all of the possible dimensions that your board could have?

- How many times as large as the original side length is the enlarged side length?
  - Use what you know about the square root of a perfect square to identify the relationship between the numbers in parts c) and d).
26. a) Determine which of the following numbers are perfect squares: 10, 100, 1000, 10 000, 100 000.
- State the square root of each perfect square.
  - Choose one of the numbers that is not a perfect square. Explain how you know that it is not a perfect square.
  - Describe a quick method for determining mentally if the numbers are perfect squares.
  - Use your method in part d) to decide if 1 000 000 000 is a perfect square.  M E
27. a) Determine the square root of each number: 6400, 640 000, 64 000 000.
- Describe a quick method for determining mentally the square root of each number in part a).
  - Explain why this method does not work for evaluating  $\sqrt{640}$ .
  - Use your method in part b) to evaluate  $\sqrt{640 000 000 000}$ . Explain how you determined the answer.  M E
