

## 4.2 Names and Formulas of Compounds

- Ionic compounds are made up of **positive** and **negative** ions.
  - ♦ All of the positive and negative ions organize in a pattern.
    - Negative-positive attract.
    - Negative-negative and positive-positive repel.
  - ♦ Ionic compounds form from the inside out as solid crystals.
  - ♦ Ionic compounds are like a solid stack of bricks.
    - A salt shaker contains thousands of small pieces of NaCl.

Salt, NaCl

See pages 184 - 185

- Covalent molecules share electrons.
  - ♦ There is generally no order to the formation of covalent molecules.
  - ♦ These molecules clump together as solids, liquids or gases.
  - ♦ <http://www.youtube.com/watch?v=NgD9yHSJ29I>

Water, H<sub>2</sub>O

- **Turn to page 185**
- **Get into partners**
- **On a seperate piece of paper complete the following**
  - ♦ **What to do #1-4**
  - ♦ **What did you find out # 1-4**
- ♦ **You have 10 minutes to complete**

# The Chemical Name and Formula of an Ionic Compound

- Ionic compounds are composed of positive ions and negative ions.
  - ♦ The name of an ionic compound = positive ion (metal) + negative ion(non metal) *-ide*.
    - *The suffix “ide” is added on to the negative ion*
  - ♦ For example, an ionic compound forms between magnesium and oxygen.
    - The positive ion is the first part of the name, magnesium.
    - The negative ion forms part of the ending of the name, oxygen.
    - Add *-ide* to the end of the name to form magnesium oxide.

Magnesium  
oxide is used  
as a drying  
agent.

See pages 186 - 187

- Lets try to name some compounds
  - ♦ Pg 187 odds (a, c, e, g etc)

**Table 4.5** Naming Ionic Compounds Containing Two Elements

Steps	Examples	
	CaI <sub>2</sub>	Na <sub>3</sub> P
1. Name the metal ion.	<ul style="list-style-type: none"> <li>• The metal ion is Ca<sup>2+</sup>.</li> <li>• The ion's name is given in the periodic table as calcium.</li> </ul>	<ul style="list-style-type: none"> <li>• The metal ion is Na<sup>+</sup>.</li> <li>• The ion's name is given in the periodic table as sodium.</li> </ul>
2. Name the non-metal ion by ending the element name with the suffix "ide."	<ul style="list-style-type: none"> <li>• The non-metal ion is I<sup>-</sup>. The element's name is iodine.</li> <li>• Changing the name to end with the suffix "-ide" gives iodide.</li> </ul>	<ul style="list-style-type: none"> <li>• The non-metal ion is P<sup>3-</sup>. The element's name is phosphorus.</li> <li>• Changing the name to end with the suffix "-ide" gives phosphide.</li> </ul>
3. Write the name of the compound.	calcium iodide	sodium phosphide

### Practice Problems

Write the names of the following ionic compounds.

- |                          |                       |                                    |
|--------------------------|-----------------------|------------------------------------|
| 1. (a) Li <sub>3</sub> N | (f) AlBr <sub>3</sub> | (k) Ca <sub>3</sub> P <sub>2</sub> |
| (b) MgBr <sub>2</sub>    | (g) CaI <sub>2</sub>  | (l) Na <sub>2</sub> O              |
| (c) Ag <sub>2</sub> O    | (h) GaI <sub>3</sub>  | (m) CdS                            |
| (d) RbF                  | (i) Ag <sub>3</sub> N | (n) Sr <sub>3</sub> P <sub>2</sub> |
| (e) AgI                  | (j) MgSe              | (o) CsF                            |

- **Ionic formulas are based on the ions of the atoms involved.**
  - ♦ Remember the naming principles above.
  - ♦ For example, what is the name of  $\text{Ca}_3\text{N}_2$ ?
    - Ca, the positive ion, is calcium.
    - N, the negative ion, is nitrogen.
    - Drop the end of the anion and add *-ide*.
    - Calcium nitride
- **The subscript gives the ratio of each type of ion in the compound.**

**In ionic compounds this is always in lowest terms.**

- ♦ In the above example there are 3 calciums for every 2 nitrogens
- ♦ \*\*\*\*\* **LOWEST TERMS ONLY FOR IONIC COMPOUNDS** \*\*\*\*\*

# The Chemical Name and Formula of an Ionic Compound (continued)

- Writing formulas for ionic compounds:
  - ♦ In an ionic compound, the positive charges balance out the negative charges.
    - The overall charge will be **zero**
  - ♦ The ratio of positive:negative charges gives the proper formula.
    - The ratio is always written in reduced form.
  - ♦ For example, what is the formula for magnesium phosphide?
    - $\text{Mg}^{2+} \text{P}^{3-}$
    - Lowest common multiple of 2 and 3 is 6
  - ♦ Try the formula for calcium oxide.

Calcium oxide, also known as "quicklime" was once produced by cooking limestone in ancient kilns.

See page 188

- calcium is  $\text{Ca}^{2+}$  oxygen is  $\text{O}^{2-}$
- 1  $\text{Ca}^{2+}$  ion and 1  $\text{O}^{2-}$  ions
- $\text{Ca}_2\text{O}_2$ , which is simplified and written as  $\text{CaO}$

# Crossover method

- **Refer to Handout**

- **Practice problems**

- ♦ **Page 188**

- **#1**  
evens
    - **#2 odds**

Steps	Examples	
	aluminum fluoride	magnesium nitride
1. Identify each ion and its charge.	aluminum: $\text{Al}^{3+}$ fluoride: $\text{F}^{-}$	magnesium: $\text{Mg}^{2+}$ nitride: $\text{N}^{3-}$
2. Determine the total charges needed to balance positive with negative.	$\text{Al}^{3+}$ :            = +3 $\text{F}^{-}$ : -1 -1 -1 = -3	$\text{Mg}^{2+}$ : + 2 + 2 + 2 = +6 $\text{N}^{3-}$ : -3 -3            = -6
3. Note the ratio of positive ions to negative ions.	1 $\text{Al}^{3+}$ ion for every 3 $\text{F}^{-}$ ions	3 $\text{Mg}^{2+}$ ions for every 2 $\text{N}^{3-}$ ions
4. Use subscripts to write the formula. A "1" is not shown in the subscripts.	$\text{AlF}_3$	$\text{Mg}_3\text{N}_2$

### ***Practice Problems***

- Write the formulas of the compounds containing the following ions.
 

(a) $\text{Na}^{+}$ with $\text{Br}^{-}$	(d) $\text{Al}^{3+}$ with $\text{S}^{2-}$
(b) $\text{Zn}^{2+}$ with $\text{I}^{-}$	(e) $\text{Ca}^{2+}$ with $\text{O}^{2-}$
(c) $\text{K}^{+}$ with $\text{S}^{2-}$	(f) $\text{Al}^{3+}$ with $\text{P}^{3-}$
- Write the formulas of the following ionic compounds.
 

(a) strontium nitride	(i) zinc oxide
(b) lithium oxide	(j) aluminum iodide
(c) silver sulfide	(k) lithium fluoride
(d) barium phosphide	(l) sodium sulfide
(e) sodium nitride	(m) zinc phosphide
(f) potassium selenide	(n) magnesium chloride
(g) cesium sulfide	(o) rubidium bromide
(h) aluminum nitride	

# Formula of an Ionic Compound with a Multivalent Metal

- Some transitional metals are multivalent, meaning they have more than one ion form.
  - ♦ On the periodic table, the most common form of the ion is listed on top.
  - ♦ In the name of the compound, **Roman numerals** are used following the positive ion to indicate which ion was used.
  - ♦ For example, what is the formula manganese (III) sulphide?
    - This manganese is  $\text{Mn}^{3+}$ .          sulfur is  $\text{S}^{2-}$
- ♦ Try the name for  $\text{TiF}_4$ 
  - titanium is  $\text{Ti}^{4+}$  or  $\text{Ti}^{3+}$           fluorine is  $\text{F}^-$
  - 1  $\text{Ti}^{4+}$  ion and 4  $\text{F}^-$  ions
  - titanium (IV) fluoride

25	2+
<b>Mn</b>	3+
	4+
Manganese	
54.9	

22	4+
<b>Ti</b>	3+
Titanium	
47.9	

See pages 189 - 191

- Lets try some
  - ◆ Page 190
    - Practice problems
      - Evens

**Table 4.9** Writing Formulas of Compounds Containing a Multivalent Metal

Steps	Examples	
	manganese(IV) sulfide	cobalt(III) oxide
1. Identify each ion and its charge.	manganese(IV): $\text{Mn}^{4+}$ sulfide: $\text{S}^{2-}$	cobalt(III): $\text{Co}^{3+}$ oxide: $\text{O}^{2-}$
2. Determine the total charges needed to balance positive with negative.	$\text{Mn}^{4+}$ : $\quad = +4$ $\text{S}^{2-}$ : $-2 -2 = -4$	$\text{Co}^{3+}$ : $+3 +3 = +6$ $\text{O}^{2-}$ : $-2 -2 -2 = -6$
3. Note the ratio of positive ions to negative ions.	1 $\text{Mn}^{4+}$ ion for every 3 $\text{S}^{2-}$ ions	2 $\text{Co}^{3+}$ ions for every 3 $\text{O}^{2-}$ ions
4. Use subscripts to write the formula. A "1" is not shown in the subscripts.	$\text{MnS}_2$	$\text{Co}_2\text{O}_3$

### Practice Problems

- Write the formulas of the following compounds containing multivalent metals.
 

(a) copper(I) nitride	(i) tin(II) sulfide
(b) iron(II) phosphide	(j) tin(II) nitride
(c) manganese(II) oxide	(k) tin(IV) nitride
(d) manganese(IV) oxide	(l) mercury(II) fluoride
(e) chromium(II) bromide	(m) copper(I) iodide
(f) chromium(III) bromide	(n) copper(II) iodide
(g) lead(IV) chloride	(o) copper(II) selenide
(h) iron(III) phosphide	

- Page 191
  - ♦ Practice problems
    - odds

**Table 4.10** Naming Ionic Compounds Containing a Multivalent Metal

Steps	Examples	
	$\text{Au}_3\text{N}$	$\text{PdS}_2$
1. Identify the metal.	gold (Au)	palladium (Pd)
2. Verify that it can form more than one kind of ion by checking the periodic table.	$\text{Au}^+$ and $\text{Au}^{3+}$	$\text{Pd}^{2+}$ and $\text{Pd}^{4+}$
3. Determine the ratio of the ions in the formula.	$\text{Au}_3\text{N}$ means 3 gold ions for every 1 nitride ion.	$\text{PdS}_2$ means 1 palladium ion for every 2 sulfide ions.
4. Note the charge of the negative ion from the periodic table.	The charge on the $\text{N}^{3-}$ ion is 3−.	The charge on the $\text{S}^{2-}$ ion is 2−.
5. The positive and negative charges must balance out. Determine what the charge needs to be on the metal ion to balance the negative ion.	Each of the 3 gold ions must have a charge of 1+ to balance the 1 nitride ion with a charge of 3−. Therefore the name of the gold ion is gold(I).	The 1 palladium ion must have a charge of 4+ to balance the 2 sulfide ions that each have a charge of 2−. Therefore, the name of the palladium ion is palladium(IV).
6. Write the name of the compound.	gold(I) nitride	palladium(IV) sulfide

### Practice Problems

Each of these compounds contains a multivalent metal ion. That means that the name of the metal ion will contain a Roman numeral, which you will need to determine. Write the names of the following compounds.

- |                                |                             |                             |
|--------------------------------|-----------------------------|-----------------------------|
| 1. (a) $\text{Fe}_2\text{O}_3$ | (f) $\text{Sn}_3\text{P}_4$ | (k) NiS                     |
| (b) $\text{PbF}_4$             | (g) $\text{MnS}$            | (l) $\text{Mo}_2\text{O}_3$ |
| (c) $\text{FeI}_2$             | (h) $\text{MnS}_2$          | (m) $\text{UCl}_6$          |
| (d) $\text{HgI}_2$             | (i) $\text{VCl}_5$          | (n) $\text{ReF}_7$          |
| (e) $\text{Hg}_3\text{N}_2$    | (j) $\text{Ni}_2\text{S}_3$ | (o) $\text{TiS}_2$          |

# Polyatomic Ions

- Some ions, called polyatomic ions, are made up of several atoms joined together with covalent bonds.
  - The whole group has a  $+$  or  $-$  charge, not the individual atoms.
  - What is the formula of sodium sulphate?  $\text{Na}^+$  and  $\text{SO}_4^{2-}$   $\text{Na}_2\text{SO}_4$
  - What is the name of the compound  $\text{KClO}$ ?  $\text{K}^+ =$  potassium  $\text{ClO}^- =$  hypochlorite  
potassium hypochlorite

**Table 4.11** Names, Formulas, and Charges of Some Polyatomic Ions

Positive Ions	Negative Ions		
$\text{NH}_4^+$ ammonium	$\text{CH}_3\text{COO}^-$ acetate	$\text{HCO}_3^-$ hydrogen carbonate, bicarbonate	$\text{NO}_2^-$ nitrite
	$\text{CO}_3^{2-}$ carbonate	$\text{HSO}_4^-$ hydrogen sulfate, bisulfate	$\text{ClO}_4^-$ perchlorate
	$\text{ClO}_3^-$ chlorate	$\text{HS}^-$ hydrogen sulfide, bisulfide	$\text{MnO}_4^-$ permanganate
	$\text{ClO}_2^-$ chlorite	$\text{HSO}_3^-$ hydrogen sulfite, bisulfite	$\text{PO}_4^{3-}$ phosphate
	$\text{CrO}_4^{2-}$ chromate	$\text{OH}^-$ hydroxide	$\text{PO}_3^{3-}$ phosphite
	$\text{CN}^-$ cyanide	$\text{ClO}^-$ hypochlorite	$\text{SO}_4^{2-}$ sulfate
	$\text{Cr}_2\text{O}_7^{2-}$ dichromate	$\text{NO}_3^-$ nitrate	$\text{SO}_3^{2-}$ sulfite

See pages 192 - 193

# Lets Practice

**Table 4.12** Writing the Formula of a Compound with Polyatomic Ions

Steps	Examples	
	manganese(III) chlorate	ammonium sulfate
1. Identify each ion and its charge.	manganese(III): $\text{Mn}^{3+}$ chlorate: $\text{ClO}_3^-$	ammonium: $\text{NH}_4^+$ sulfate: $\text{SO}_4^{2-}$
2. Determine the total charges needed to balance positive with negative.	$\text{Mn}^{3+}$ : $= +3$ $\text{ClO}_3^-$ : $-1 -1 -1 = -3$	$\text{NH}_4^+$ : $+1 +1 = +2$ $\text{SO}_4^{2-}$ : $= -2$
3. Note the ratio of positive ions to negative ions.	1 $\text{Mn}^{3+}$ ion for every 3 $\text{ClO}_3^-$ ions	2 $\text{NH}_4^+$ ions for every 1 $\text{SO}_4^{2-}$ ion
4. Use brackets around ions to correctly show the ratio of ions.	$(\text{Mn})(\text{ClO}_3)_3$	$(\text{NH}_4)_2(\text{SO}_4)$
5. Use subscripts and brackets to write the formula. Omit brackets if not needed.	$\text{Mn}(\text{ClO}_3)_3$	$(\text{NH}_4)_2\text{SO}_4$

- Page 193
- ♦ #1 Evens
- ♦ #2 Odds

## Practice Problems

Refer to Table 4.11, Names, Formulas, and Charges of Some Polyatomic Ions, as you do these problems.

- Write the names of the following compounds with polyatomic ions.
 

(a) $\text{KCH}_3\text{COO}$	(f) $\text{Fe}(\text{OH})_3$
(b) $\text{Ca}(\text{CH}_3\text{COO})_2$	(g) $\text{K}_2\text{CrO}_4$
(c) $(\text{NH}_4)_3\text{P}$	(h) $\text{K}_2\text{Cr}_2\text{O}_7$
(d) $(\text{NH}_4)_3\text{PO}_4$	(i) $\text{Ca}(\text{HCO}_3)_2$
(e) $\text{Al}(\text{OH})_3$	(j) $\text{Mg}_3(\text{PO}_4)_2$
- Write the formulas of the following compounds with polyatomic ions.
 

(a) potassium permanganate	(f) lead(II) perchlorate
(b) sodium chromate	(g) iron(III) hydrogen sulfide
(c) ammonium nitrate	(h) vanadium(V) nitrate
(d) lithium hydroxide	(i) magnesium acetate
(e) aluminum hydroxide	(j) tin(II) cyanide

# Names and Formulas of Covalent Compounds

- Covalent compounds, also called molecules, rely on the chemical formula to reveal the components of the molecule.
  - ♦ Covalent compounds are made up of two or more **non-metals**.
  - ♦ Names may reveal the components, but often they do not.
  - ♦ Subscripts mean something different in covalent compounds
    - Ionic compounds subscripts show the smallest whole-number ratio between the ions in the compound.
    - Covalent molecules have subscripts that show the **actual** number of atoms in the molecule.
  - ♦ Nitrogen monoxide vs dinitrogen dioxide

See page 193

# Naming Binary Covalent Compounds

- Binary covalent compounds (two non-metal atoms) use a system of prefixes.
  - ♦ Covalent compounds may have many or few atoms sharing electrons.
    - $\text{CH}_4$  = methane and  $\text{C}_{25}\text{H}_{52}$  = candle wax
  - ♦ Prefixes are often used before the atom name to indicate the number of atoms in the molecule.
  - ♦ If there is only one of the first atom, no prefix is needed (ONLY FOR FIRST ATOM)
    - $\text{CO}$  = carbon monoxide,  $\text{CO}_2$  = carbon dioxide
  - ♦ Write the most metallic atom (farthest left) first
    - Add *-ide* to the end of the second atom's name
  - ♦ What is the chemical formula for the molecule trinitrogen tetrachloride?
    - $\text{N}_3\text{Cl}_4$
  - ♦ What is the name of the molecule  $\text{Si}_3\text{P}_6$ ?
    - **Trisilicon hexaphosphide**

**Table 4.13** Prefixes Used in Naming Binary Covalent Compounds

Prefix	Number
mono-	1
di-	2
tri-	3
tetra-	4
penta-	5
hexa-	6
hepta-	7
octa-	8
nona-	9
deca-	10

See pages 194 - 195

# Practice

- Page 195
- ♦ #1 Evens
- ♦ #2 Odds

**Table 4.14** Writing the Names of Binary Covalent Compounds

Steps	Examples	
	CO	N <sub>2</sub> O <sub>3</sub>
1. Name the left most element in the formula first.	• The first element is C (carbon).	• The first element is N (nitrogen).
2. Name the second element, making sure the element name ends with the suffix "ide."	• The second element is O (oxygen). • It becomes oxide.	• The second element is O (oxygen). • It becomes oxide.
3. Add a prefix to each element's name to indicate the number of atoms of each element in the compound. Exceptions to rule 3: • If the first element has only one atom, do <i>not</i> add a prefix. • The prefix "mono-" is shortened to "mon-" if it is placed before "oxide."	• Do not use a prefix when there is only one atom of the first element. • The compound's name is carbon monoxide.	• There are two (di-) nitrogen atoms and three (tri-) oxygen atoms. • The compound's name is dinitrogen trioxide.

**Table 4.16** Hints for Writing Names of Binary Covalent Compounds

Formula	Name	Hints for Writing Names
CS <sub>2</sub>	carbon disulfide	Do not use a prefix when there is only one atom of the first element.
CCl <sub>4</sub>	carbon tetrachloride	Do not use a prefix when there is only one atom of the first element.
P <sub>4</sub> O <sub>10</sub>	tetraphosphorus decaoxide	Do not reduce the name to diphosphorus pentoxide.

## Practice Problems

- Write the names of the following compounds.
 

(a) N <sub>2</sub> O	(f) N <sub>2</sub> O <sub>4</sub>
(b) CO <sub>2</sub>	(g) P <sub>4</sub> S <sub>10</sub>
(c) PI <sub>3</sub>	(h) S <sub>2</sub> F <sub>10</sub>
(d) PCl <sub>5</sub>	(i) NI <sub>3</sub>
(e) SO <sub>2</sub>	(j) NO
- Write the formulas of the following compounds.
 

(a) nitrogen tribromide	(f) sulfur trioxide
(b) sulfur hexafluoride	(g) phosphorus pentabromide
(c) dinitrogen tetrasulfide	(h) diiodine hexachloride
(d) oxygen difluoride	(i) dichlorine monoxide
(e) carbon tetraiodide	(j) xenon hexafluoride

# Comparing Ionic and Covalent Compounds

- **To determine whether a compound is ionic or covalent:**
  - 1. Examine the formula.**
    - Ionic compounds start with a metal or the ammonium ion.
    - Covalent compounds start with a non-metal.
  - 2. If the compound is ionic:**
    - Check the metal to see if it is multivalent (add a Roman numeral if it is multivalent). Naming starts with the name of the metal atom.
    - If it ends with a single non-metal, naming will just end in *-ide*.
    - If it ends in a polyatomic ion, look up the name/formula.
  - 3. If the compound is covalent:**
    - Use the prefix system of naming if the compound is binary and does not start with hydrogen.
    - If there are more than two different elements, or it starts with H, there is probably a different, simpler name for the covalent molecule.

See pages 196 - 197

[Take the Section 4.2 Quiz](#)

(c) McGraw Hill Ryerson 2007

# Practice

- Page 197
  - ♦ #1 Evens
  - ♦ #2 Odds

## ***Practice Problems***

1. Identify each of the following compounds as either ionic or covalent.

(a) $(\text{NH}_4)_2\text{S}$	(e) $\text{N}_2\text{O}_3$
(b) $\text{OCl}_2$	(f) $\text{SCl}_2$
(c) $\text{SnCl}_2$	(g) $\text{NBr}_3$
(d) $\text{NaNO}_3$	(h) $\text{FeF}_2$
2. The compounds in each group below have similar-looking formulas. However, they may have very different names. Some in each group are ionic, while others are covalent. Classify and name each compound.

(a) $\text{VO}_2$ $\text{NO}_2$	(d) $\text{SO}_3$ $\text{Li}_2\text{SO}_3$ $\text{Li}_2\text{SO}_4$ $\text{SO}_2$
(b) $\text{CrBr}_2$ $\text{CdBr}_2$ $\text{SBr}_2$	(e) $\text{OCl}_2$ $\text{BeF}_2$ $\text{FeF}_2$
(c) $\text{Na}_2\text{Cr}_2\text{O}_7$ $\text{Na}_2\text{CrO}_4$ $\text{Cr}_2\text{O}_3$ $\text{N}_2\text{O}_3$	(f) $\text{CO}_2$ $\text{NaHCO}_3$ $\text{PbCO}_3$
