

4.3 Balancing Chemical Equations

- **Chemical reactions result in chemical changes.**
 - ◆ **Chemical changes occur when new substances are created by change in the arrangements and connections between ions and atoms.**
 - ◆ **The original substance(s), called reactants, change into new substance(s) called products.**
 - ◆ <https://www.youtube.com/watch?v=2S6e11NBwiw>

Chemical Equations

- **Chemical reactions can be written in different ways.**

- ♦ **A word equation:**

- **Nitrogen monoxide + oxygen → nitrogen dioxide**

- ♦ **A symbolic equation:**

Coefficients

- Indicate the ratio of compounds in the reaction.

- Here, there is twice as much NO and NO₂ than as is O₂.

- 2 molecules of NO react with one molecule of O₂ to produce two molecules of NO₂

State of matter

- Letters indicate the state of each compound.

(aq) = aqueous/dissolved in water

(s) = solid

(l) = liquid

(g) = gas

So Why do we have to balance the equation?

- **Conservation of Mass in Chemical Change**
- **Chemical change means new compounds are created.**
 - ◆ No new matter is created or destroyed; atoms are just rearranged.
 - ◆ All of the matter in the reactants = all of the matter in the products.
 - ◆ John Dalton, 200 years ago, realized that atoms simply rearrange themselves during chemical reactions.
 - ◆ Number of each atom in reactants = number of each atom in products.
- **The law of conservation of mass:**
 - ◆ In chemical reactions, atoms are neither created nor destroyed.
 - ◆ This law was developed by Antoine and Marie-Anne Lavoisier in the 1700s.
 - ◆ Mass of reactants = mass of products

Writing and Balancing Chemical Equations

- The simplest form of chemical equation is a word equation.
 - ♦ Potassium metal + oxygen gas → potassium oxide

Reactants appear on left side of arrow.

Plus sign on left side means "reacts with."

Arrow means "produces."

Plus sign on right side means "plus."

Products appear on right side of arrow.

See page 206

Balancing continued

- A skeleton equation shows the formulas of the elements/compounds.
 - ◆ A skeleton equation shows atoms, but not quantities of atoms.
 - $K + O_2 \rightarrow K_2O$
 - Needs to be balanced
- A balanced chemical equation shows all atoms and their quantities
 - ◆ Balancing ensures that the number of each atom is the same on both sides of the reaction arrow.
 - ◆ Always use the smallest whole-number ratio.
 - $4K + O_2 \rightarrow 2K_2O$
 - 4:1:2
 - 4 molecules of K react with one molecule of O_2 to produce two molecules of K_2O
 - Can “double” the recipe

Counting Atoms to Balance an Equation

- Using the law of conservation of mass, we can count atoms to balance the number of atoms in chemical equations.

◆ Word equation: methane + oxygen → water + carbon dioxide

◆ Skeleton equation: $\text{CH}_4 + \text{O}_2 \rightarrow \text{H}_2\text{O} + \text{CO}_2$

- To balance the compounds, take note of how many atoms of each element occur on each side of the reaction arrow.

The same number of atoms must be on each side.

◆ Skeleton equation: $\text{CH}_4 + \text{O}_2 \rightarrow \text{H}_2\text{O} + \text{CO}_2$

1 carbon, 4 hydrogen, 2 oxygen → 1 carbon, 2 hydrogen, 3 oxygen

◆ To balance, attempt to find values that equate atoms on both sides

◆ Balanced equation: $\text{CH}_4 + 2\text{O}_2 \rightarrow 2\text{H}_2\text{O} + \text{CO}_2$

1 carbon, 4 hydrogen, (2×2) oxygen → 1 carbon, (2×2) hydrogen, (2×1)+2 oxygen

Hints for Writing Word Equations

- **Word equations require careful examination to be written correctly.**
 - ◆ **The chemical symbol is used for most elements not in a compound.**
 - **Be careful of diatomic and polyatomic elements such as O₂, P₄ and S₈.**
 - **The “special seven” are all diatomic elements**
 - **Make a 7 on periodic table except for hydrogen**
 - **Known as the “gens”why?**
 - **H₂, N₂, O₂, F₂, Cl₂, Br₂, I₂**
 - ◆ **Memorized Several common covalent molecules containing hydrogen that have common names that you should know.**
 - **For example, methane = CH₄, glucose = C₆H₁₂O₆, ethane = C₂H₆, ammonia = NH₃, water H₂O**

			1		
			1 + H Hydrogen 1.0		18

See page 208

Strategies for Balancing Equations

- **Balance chemical equations by following these steps:**
 - ◆ Trial and error will work but can be very inefficient.
 - ◆ Balance compounds first and elements last.
 - ◆ Balance one compound at a time.
 - ◆ Only add coefficients; **NEVER** change subscripts.
 - ◆ If H and O appear in more than one place, attempt to balance them **LAST**.
 - ◆ Polyatomic ions (such as SO_4^{2-}) can often be balanced as a whole group.
 - ◆ Always double-check after you think you are finished.
